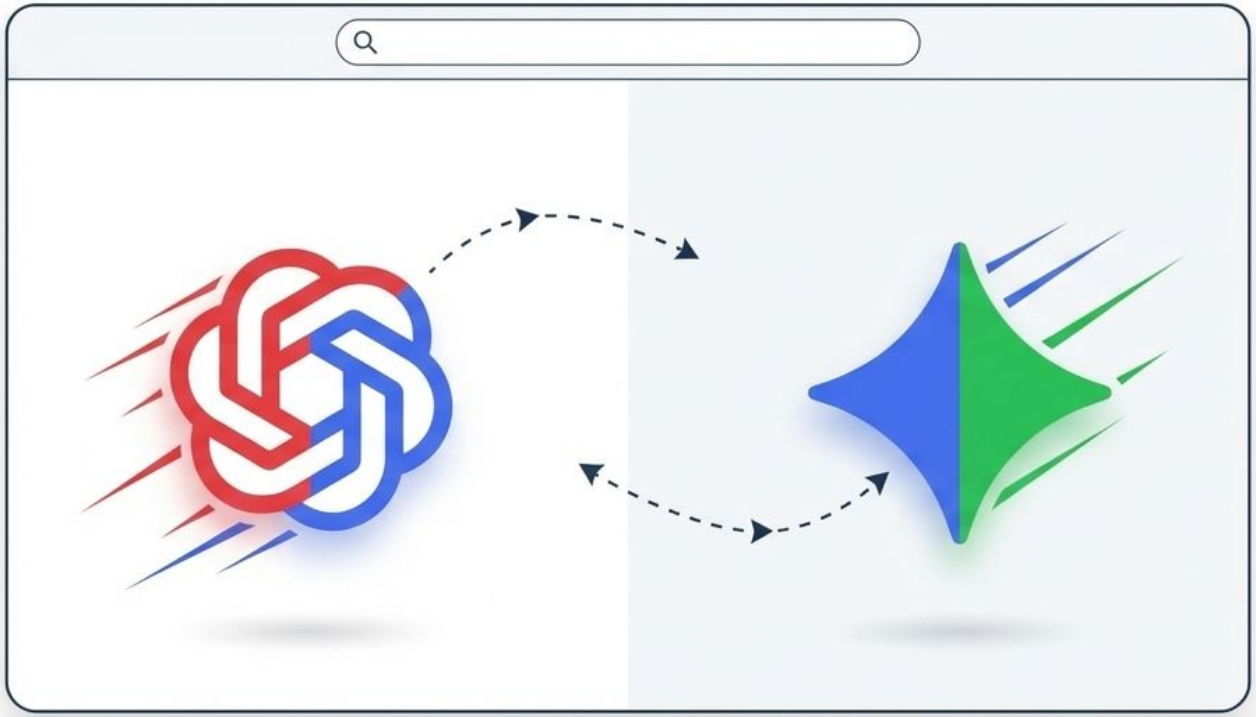
OpenClaw Tutorial By Intellipaat

NotebookLM

We use these every single day.

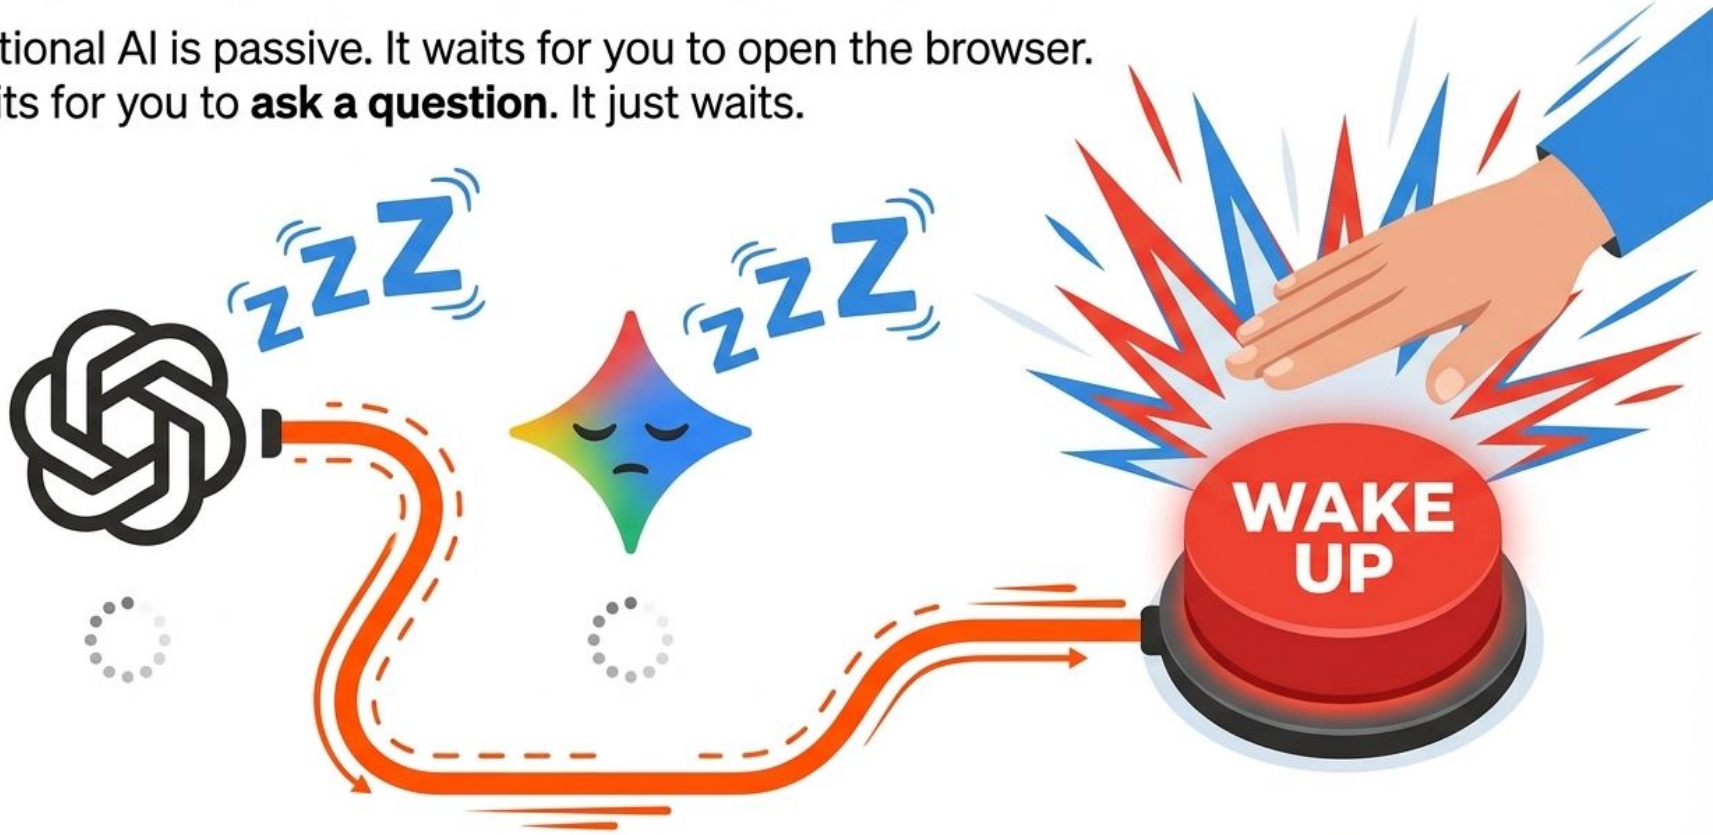
ChatGPT and Gemini are incredibly smart, but they share one major limitation.



NotebookLM

They only work when you push a button.

Traditional AI is passive. It waits for you to open the browser.
It waits for you to **ask a question**. It just waits.



NotebookLM

What if your AI worked in the background?

Imagine an assistant that organizes your emails, checks your calendar, and messages you on Telegram automatically—just like a real human.

NotebookLM

OpenClaw

Not just a normal chatbot. A fully autonomous AI agent that actually works for you.

NotebookLM

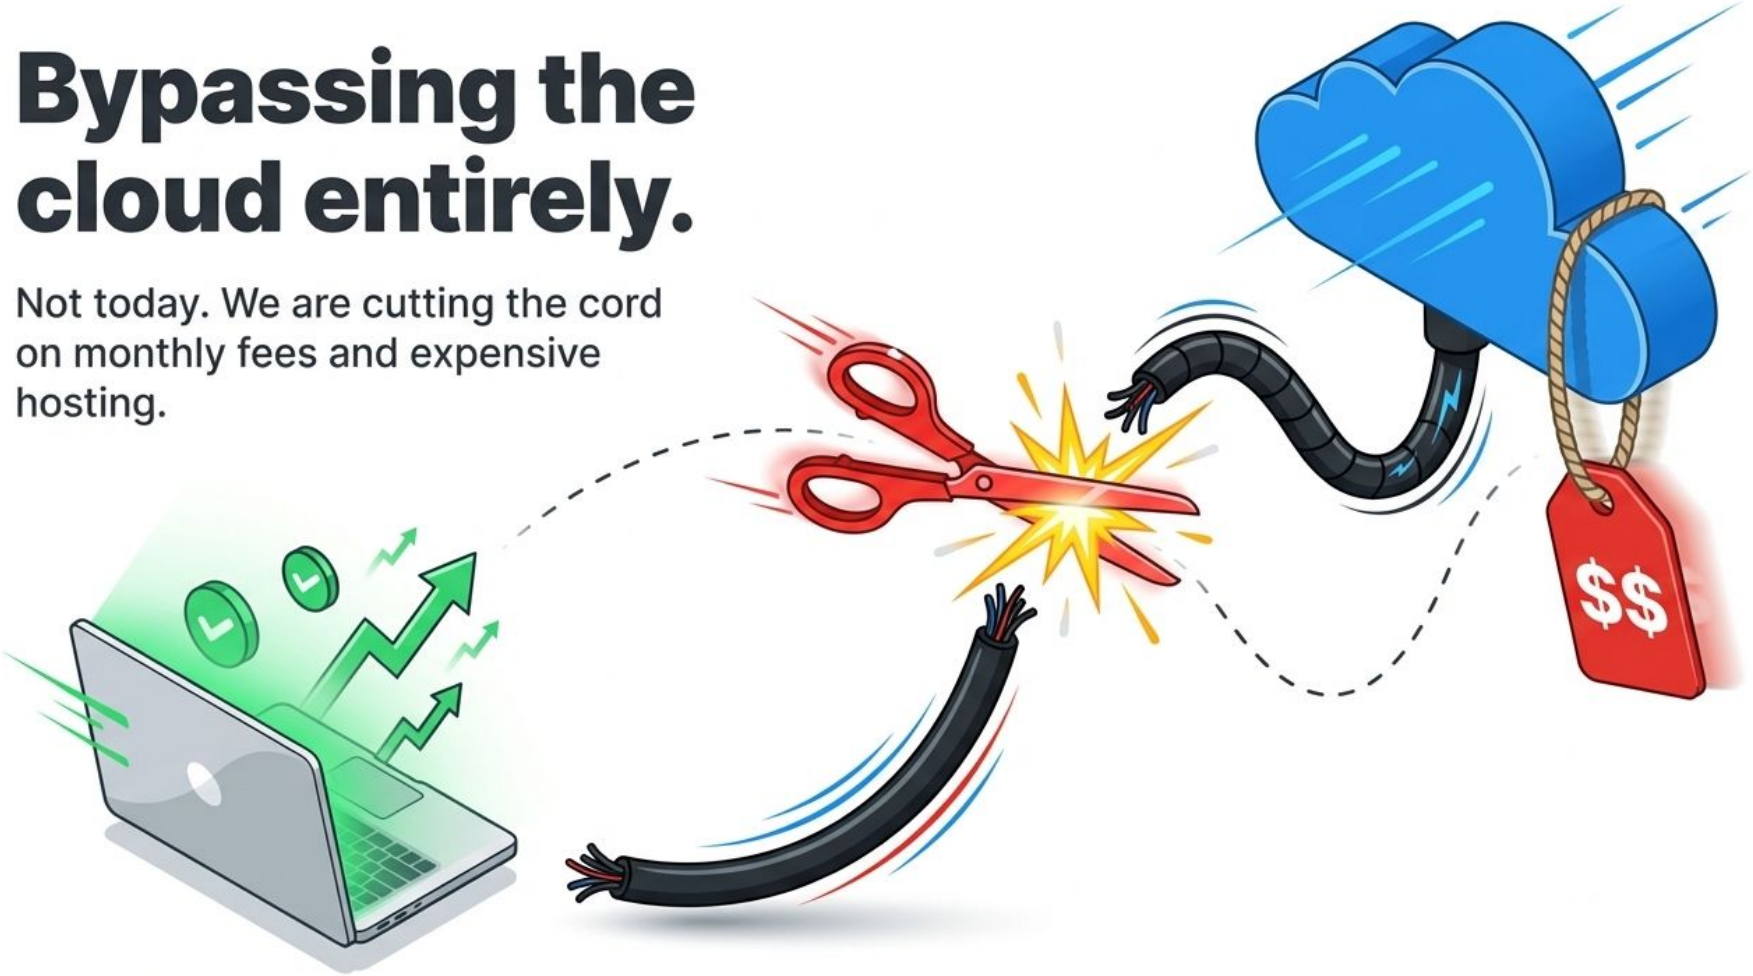
It runs on a continuous loop.

Once you start it, OpenClaw manages multiple tasks on its own. No waiting for prompts.

NotebookLM

Bypassing the cloud entirely.

Not today. We are cutting the cord on monthly fees and expensive hosting.



NotebookLM

Let’s Setup OpenClaw Bot

NotebookLM

You just built your own AI.

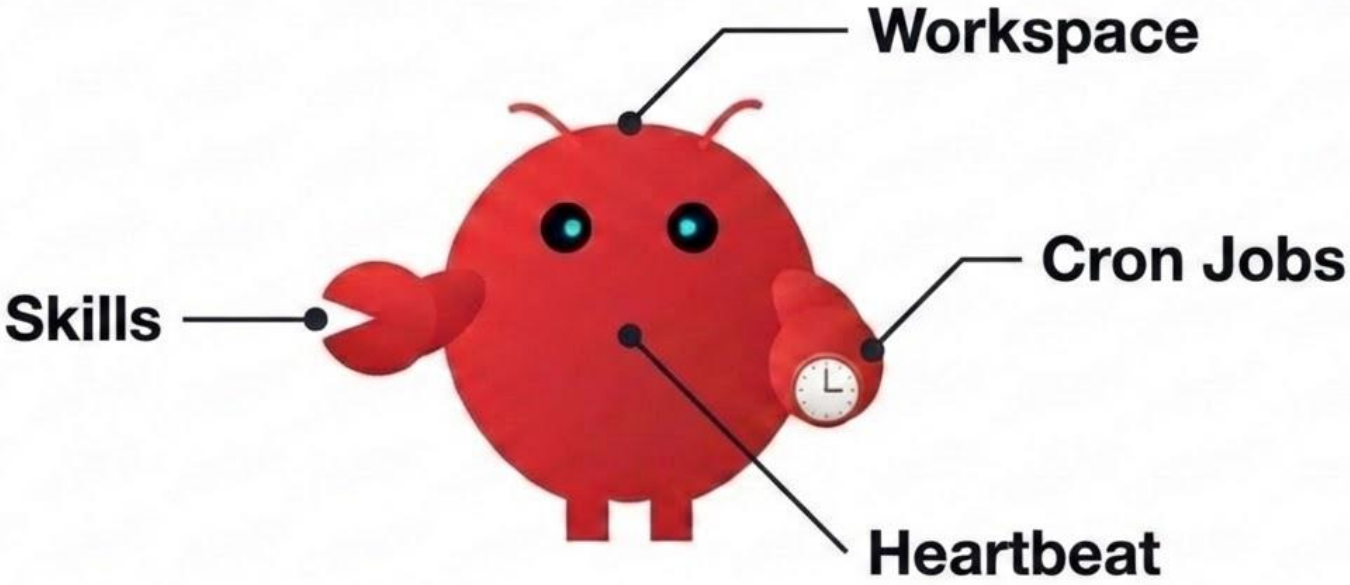
NotebookLM

The basic setup is complete.

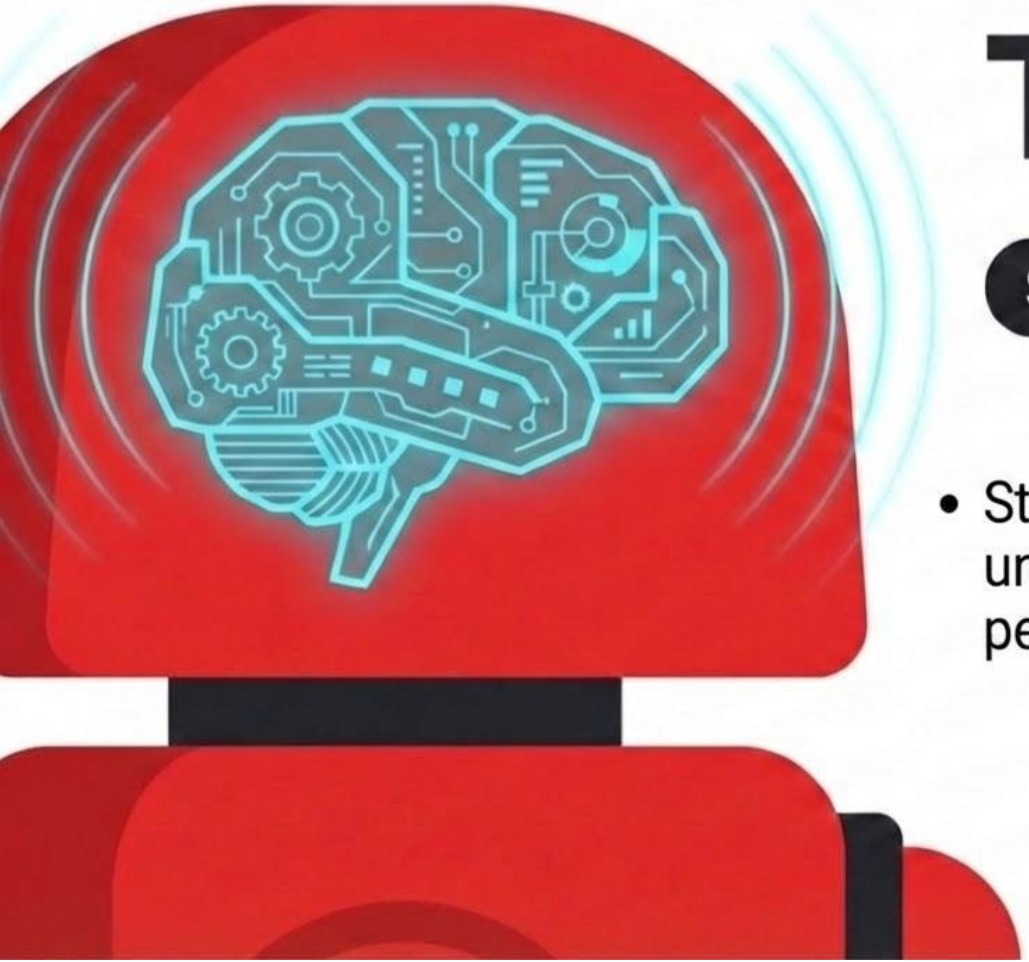
Before we make it do crazy things, we need to look under the hood.

NotebookLM

The entire architecture comes down to four living parts.



NotebookLM



The Brain

System: Workspace

- Stores its unique personality.
- Holds your strict rules.
- Keeps long-term memory.

NotebookLM

The Hands

System: Skills

The plugins that let the bot reach out and interact with other apps.

NotebookLM

The Alarm Clock

System: Cron Jobs

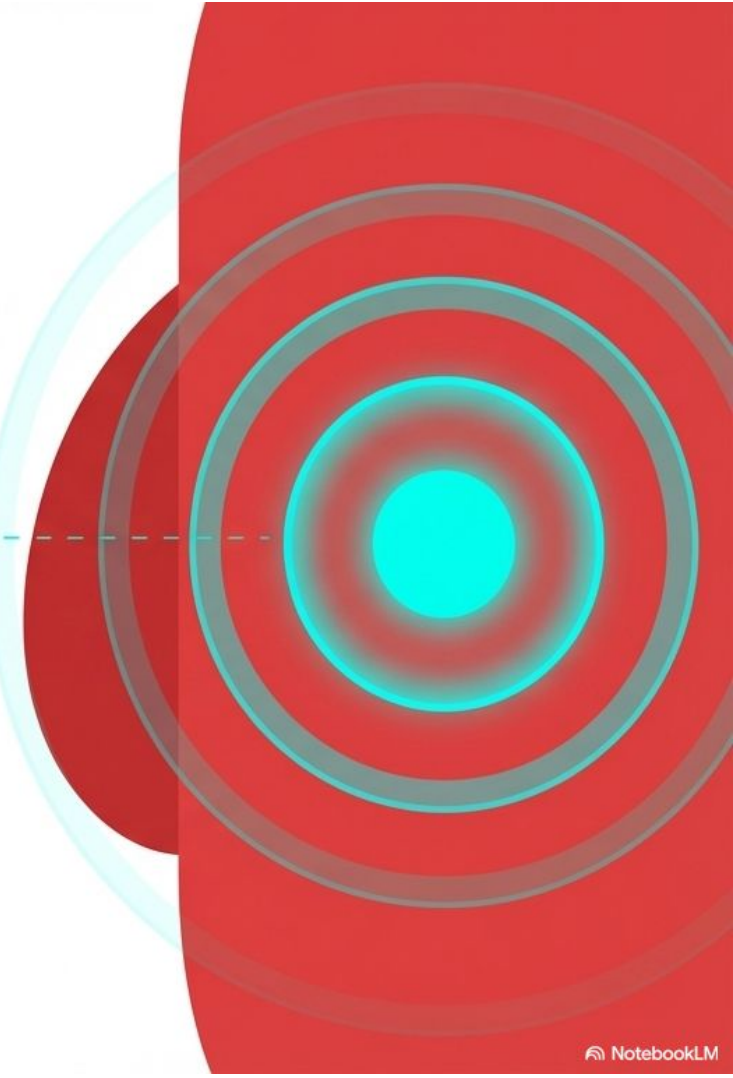
Tells the bot to run specific tasks at exact times.

NotebookLM

The Pulse

System: Heartbeat

Your background monitor. It wakes the bot up every few minites to check for urgent updates.



NotebookLM

Master these four, and you can automate literally anything.

NotebookLM

Let’s start with the first one.

Skills.

NotebookLM

Your bot is alive, but it is trapped.

Right now, it is basically just a normal chatbot. It lives inside Telegram and can only chat with you.

NotebookLM

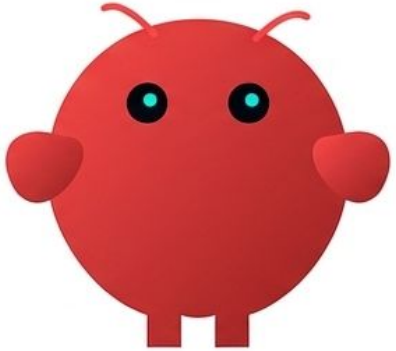
It cannot take action in the real world.

It can talk, but it cannot actually do things outside of your chat.

NotebookLM

The solution: OpenClaw Skills

To fix this and give it real superpowers, we use Skills. Think of them as plugins or mini-apps for your AI.



NotebookLM

Snap on new abilities in seconds.

Skills plug directly into your bot to instantly expand what it can do.

NotebookLM

Where do we find these skills?

Welcome to ClawHub. The official, open-source marketplace for **OpenClaw**.

NotebookLM

It is the App Store for your bot.

Browse, download, and install new superpowers
just like you would on your phone.

Phone World

OpenClaw World

ClawHub

NotebookLM

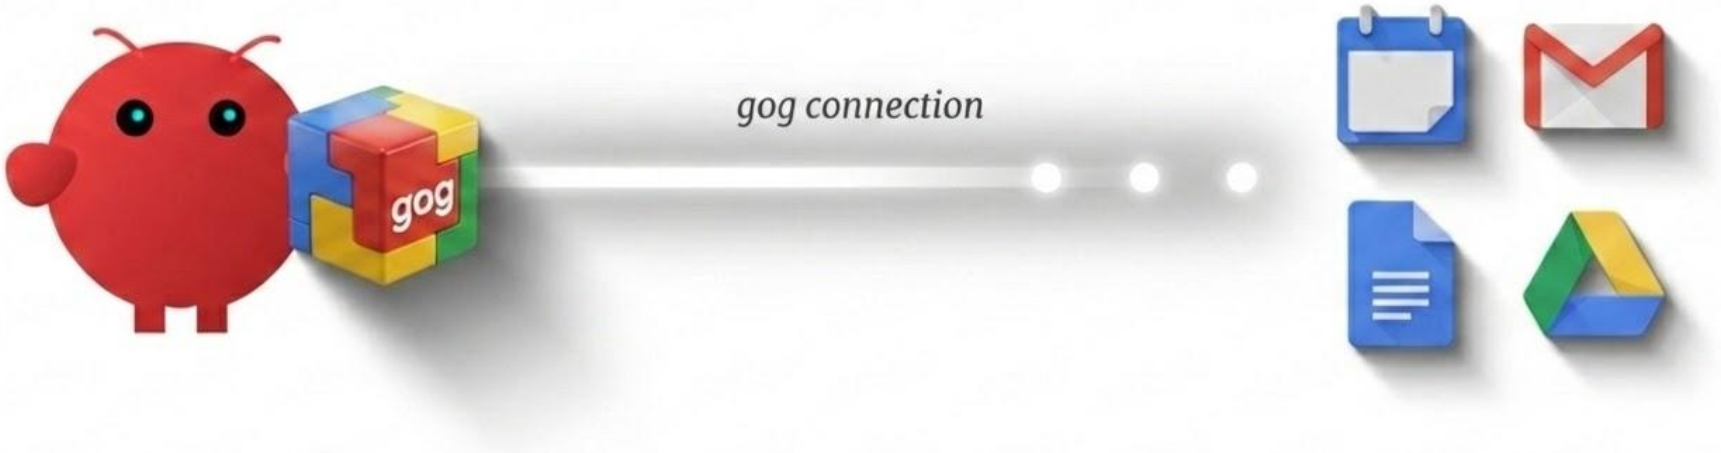
Your very first download.

The most popular and useful skill to install first is called gog.

NotebookLM

Direct access to your digital life.

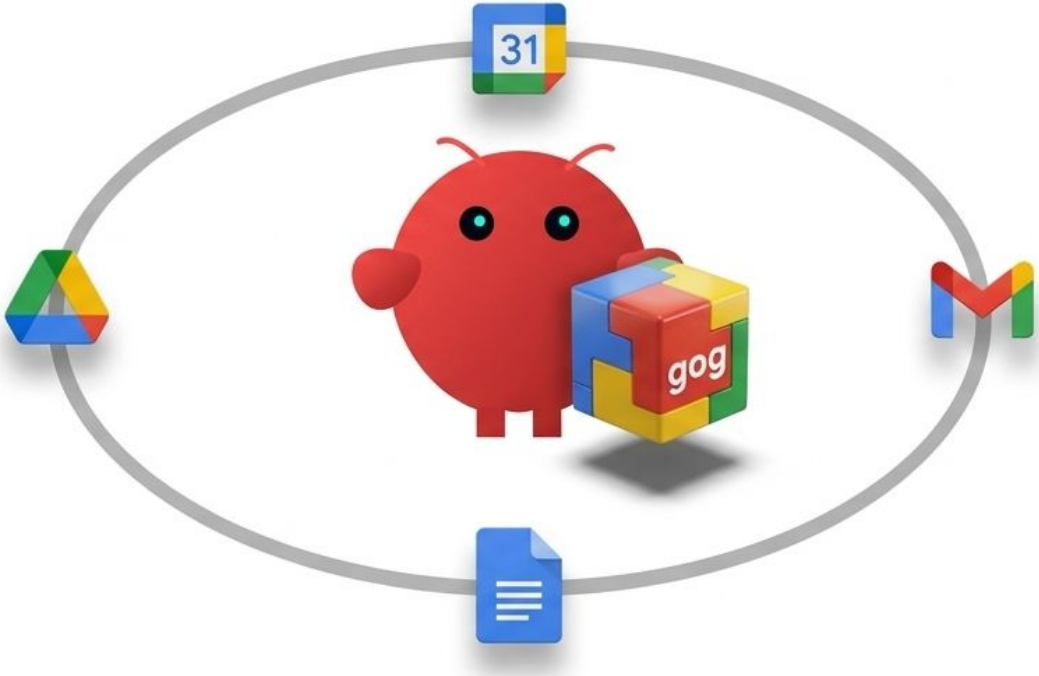
‘gog’ connects your local bot directly to your Google Workspace.



NotebookLM

From basic chat to ultimate assistant.

By installing your first skill from ClawHub, your bot steps out of Telegram and starts managing your Calendar, Docs, and Drive for you.



NotebookLM

Meet OpenClaw: The AI You Actually Control

A radically simple bot built for everyday users.
No code required.

NotebookLM

The Myth

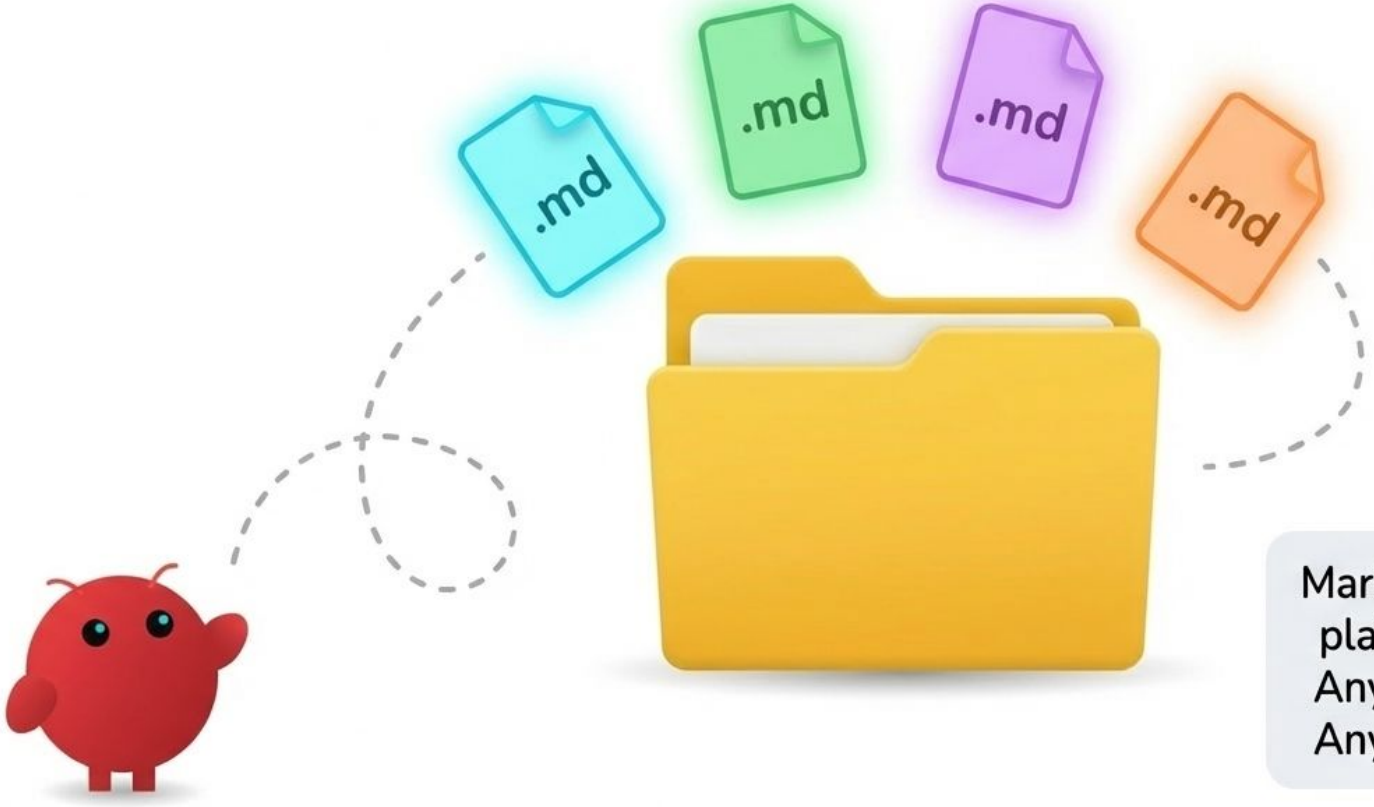
Normal ChatGPT: A complicated, heavy database you can’t see inside.

The Reality

OpenClaw: Just a standard Windows folder.

NotebookLM

The Entire “Brain” is Just Four Simple Text Files



Markdown (.md) files are plain text documents. Anyone can read them. Anyone can edit them.

NotebookLM

Agents.md is the Strict Rulebook

- ✅ Defines exactly what the bot must do.
- ✅ The bot must follow these rules—no questions asked.

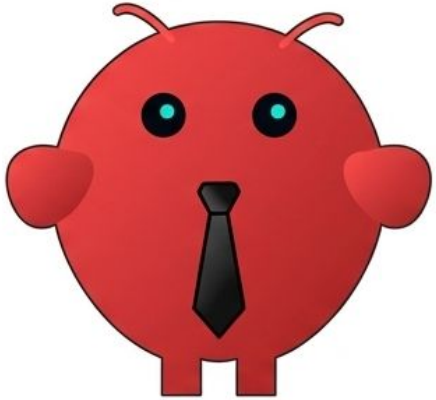
NotebookLM

Soul.md is the Bot’s Personality

Why sound like a boring robot? Tell the bot exactly how to talk and interact with you.

Strict Teacher

Chill Friend



Professional

NotebookLM

User.md Remembers Everything About You

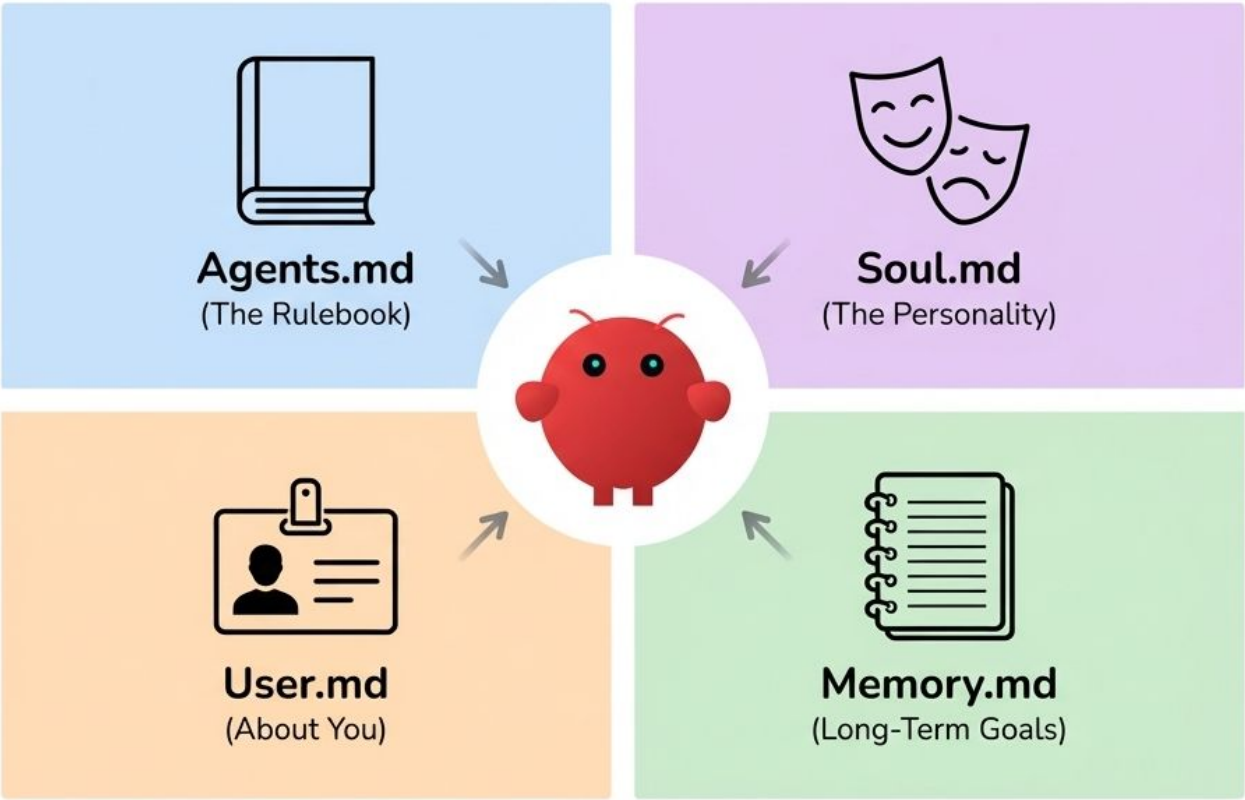
Saves your personal details, job, and hobbies. You will never have to repeat yourself in every single chat again.

NotebookLM

Memory.md is the Long-Term Notebook

The bot writes down your current projects, goals, and things it needs to remember for next week or next month.

NotebookLM



Four Simple Files. One Complete Brain.

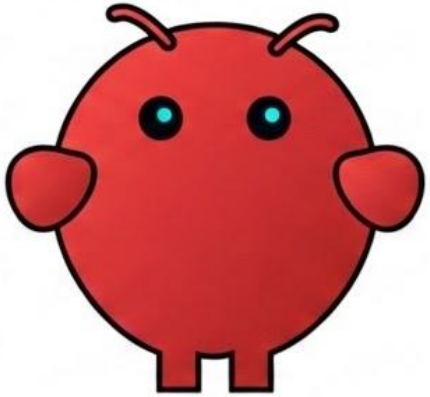
NotebookLM

Edit Your Bot’s Brain Directly From Telegram

No code editors. No complicated software.
Just text your bot to update its files.

NotebookLM

Making Your Bot Work in the Background



NotebookLM

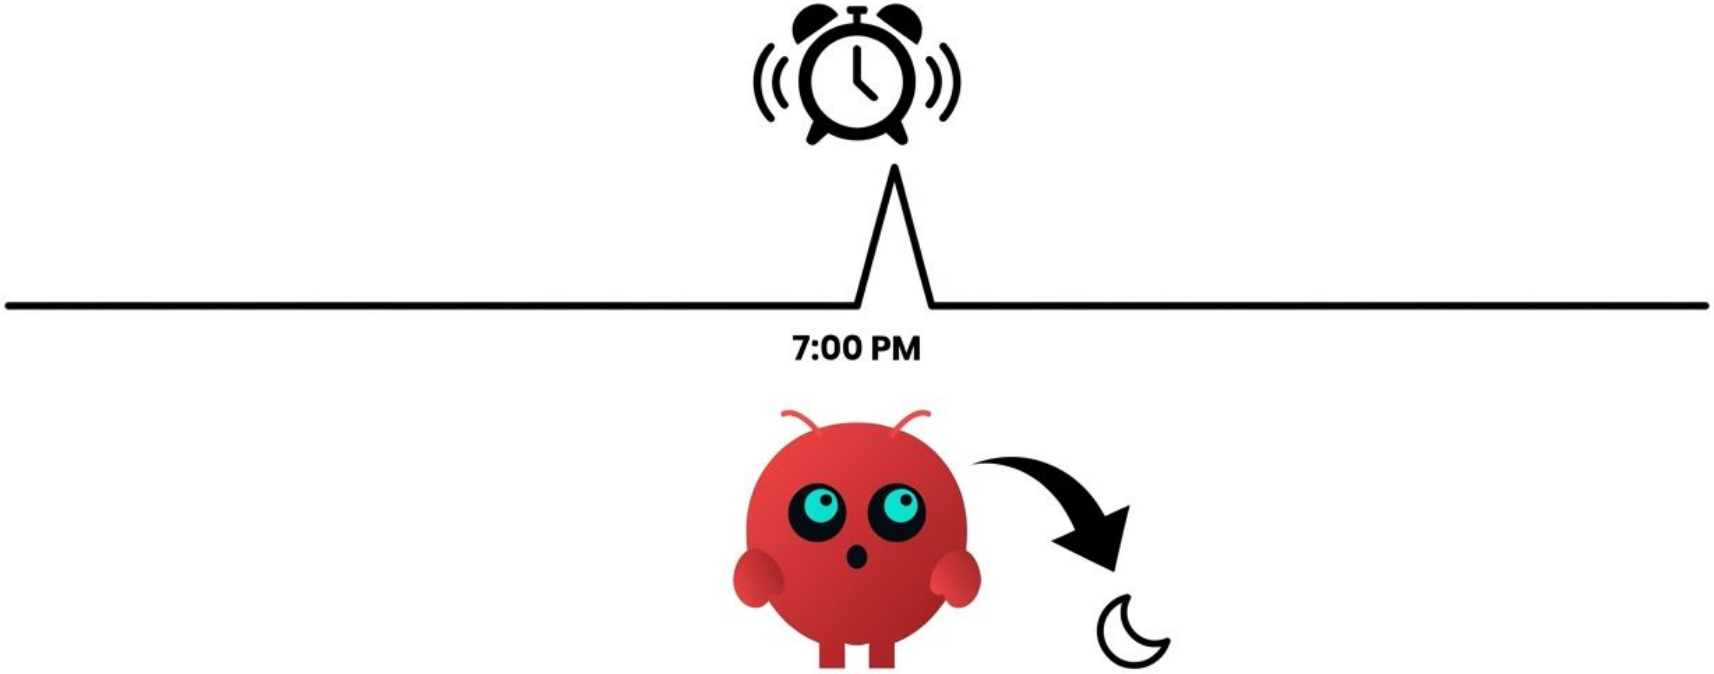
OpenClaw has two ways to wake up.

Cron Jobs

Heartbeat

NotebookLM

The Alarm Clock



Runs at an exact time you set. Wakes up, does the job, goes back to sleep.

NotebookLM

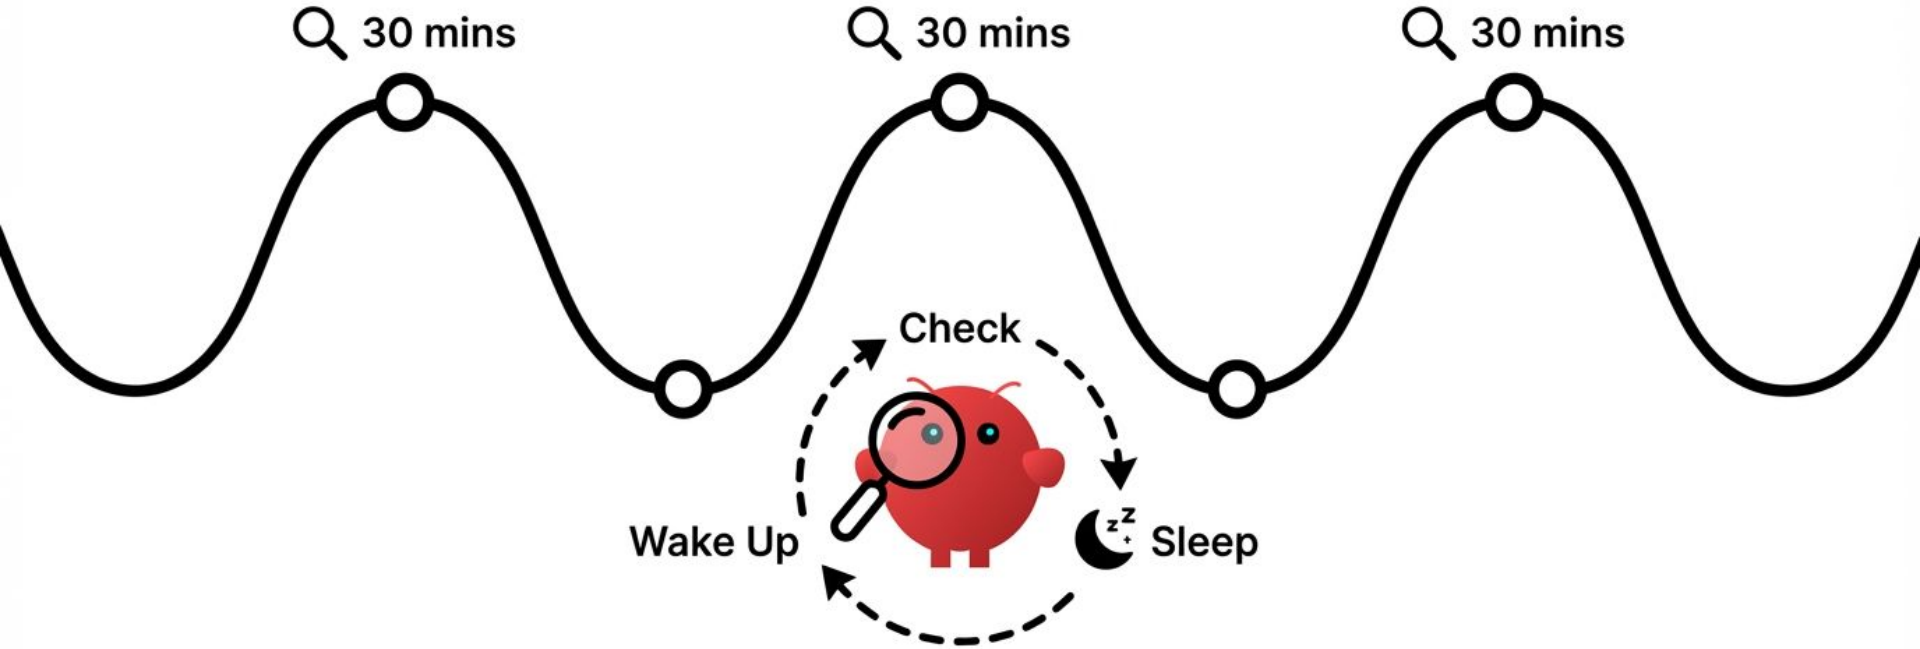
Create a Cron Job: Every evening at 7 PM, remind me to do my Guitar practice.

Boom, done.

Perfect for daily summaries and scheduled routines.

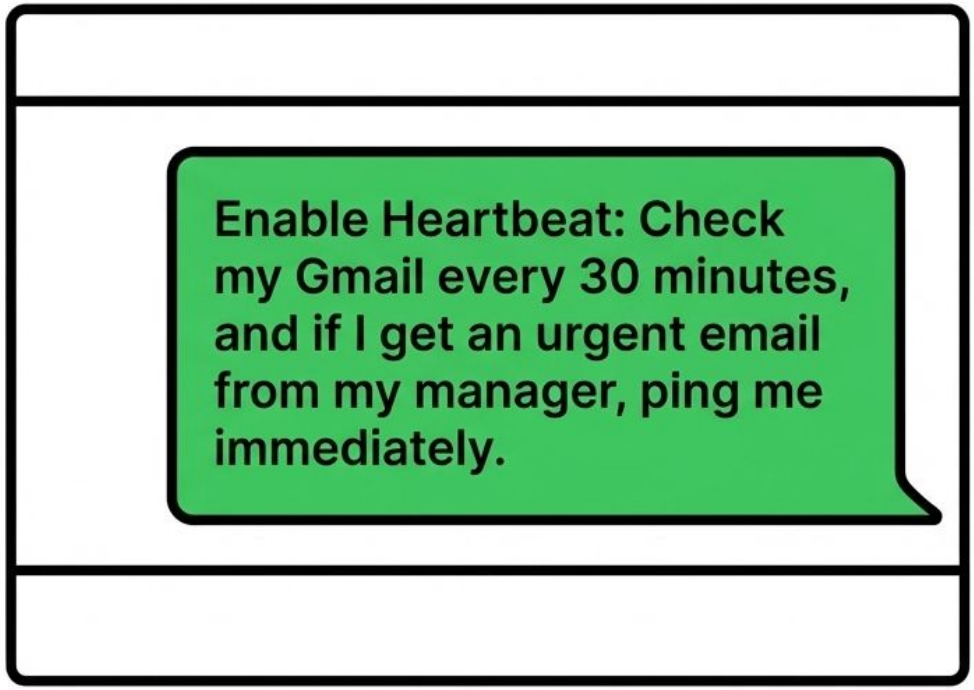
NotebookLM

The Security Guard



Wakes up every 30 minutes, checks if something happened, goes back to sleep.

NotebookLM



Perfect for continuous background monitoring.

NotebookLM

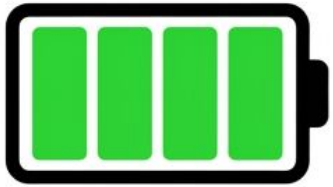
The Hidden Cost

Large Language Model API

Waking the bot up every 30 minutes uses your API tokens.

NotebookLM

Cron Job



Heartbeat

Do not put heavy, routine tasks in Heartbeat, or it will drain your credits fast.

NotebookLM

The Simple Rule

What do you need?

Happens at a fixed time?

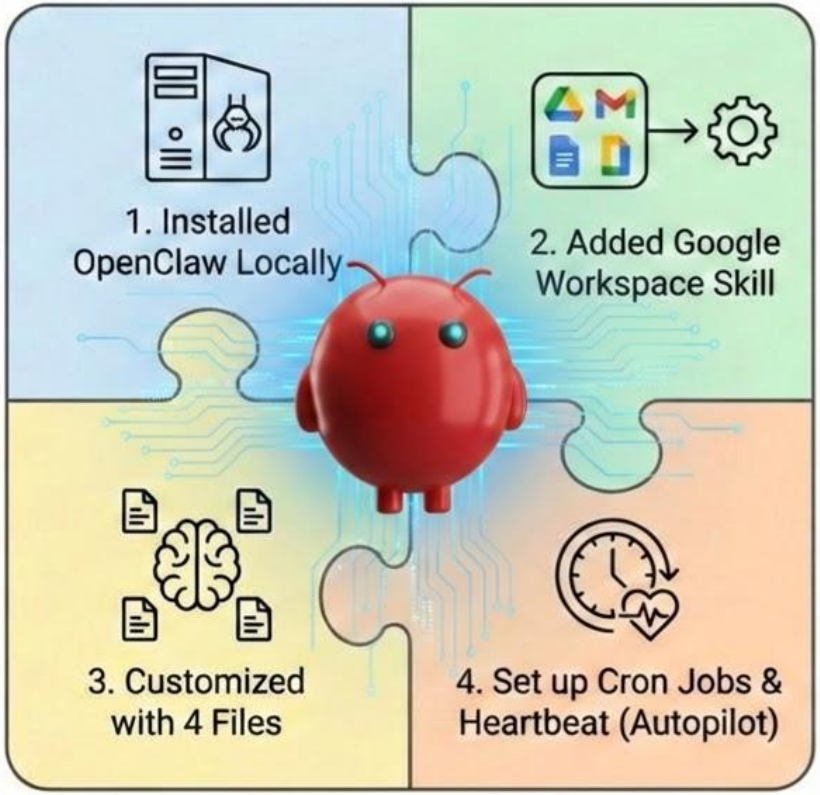
Create a Cron Job.

Urgent background checks?

Enable Heartbeat.

NotebookLM

OpenClaw Setup Recap: 4 Simple Steps



It runs right here.

On your Windows PC.

NotebookLM

It even texts you on Telegram.

NotebookLM

The Best Part? Zero Rupees.

Cloud Servers:
Costs money.

Your OpenClaw:
Completely Free!
